ABSTRACT:

In this Project I tried to find a way to check the essay written on particular subject. Here we use to take the text file of essay and try to check the essay based on spelling mistake and by matching the desired keyword related to that particular subject.

INTRODUCTION:

This project is about how to check the essay written by any child on any particular subject.

So, to check the essay I used python code, and Django to make a web frame so that it become easy to upload the text file or direct copy- paste the text in the given area and then after we can give some keyword which will check that essay is written about our desired subject or not.

In this it also check the spelling mistake and give the marks basis on both percentage of keyword match and spelling mistake.

If we see fig-a that is the front end of website essay checker and in fig- b there is a two box

One is for direct pasting the essay or writing essay in given field and second one is for uploading the text file of essay.

In both box there is one more field given for both box that is for giving the keyword which will check that is the keyword is present in essay or not so that we can get it the essay is about our desired subject.

Fig- A

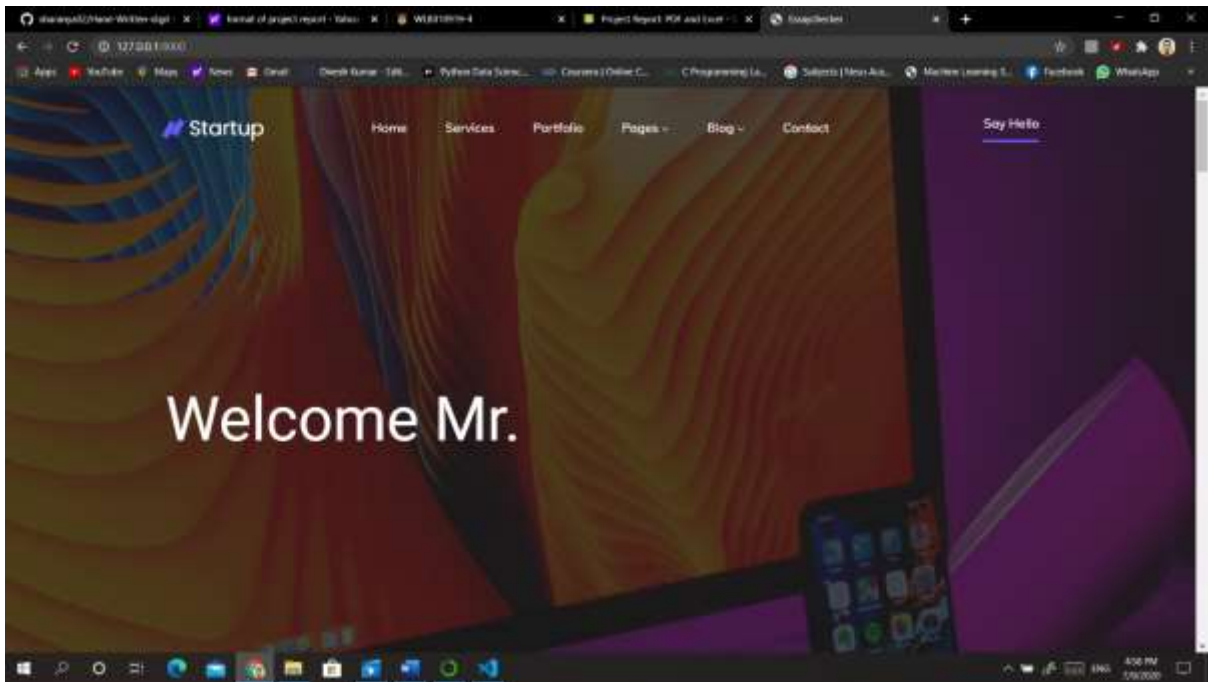

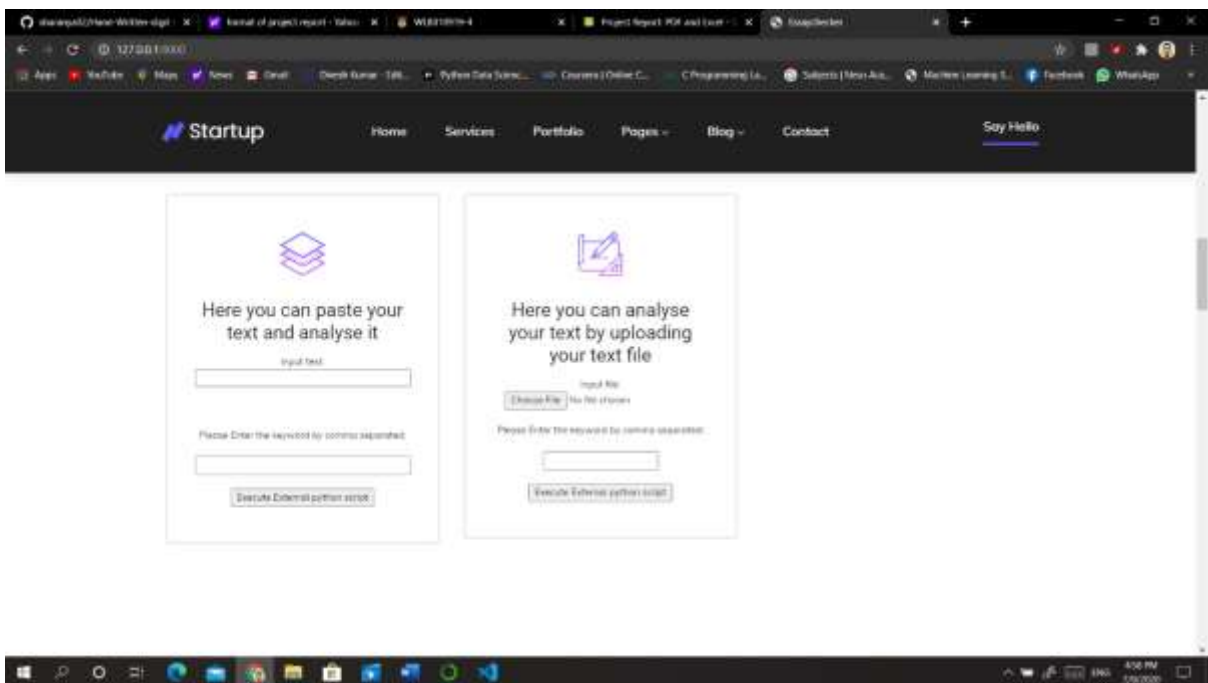

Fig- B

RESULTS:

So, the algorithm I used in this project will check the essay based on spelling mistake and keyword matching and marking will be 50% for correct spelling and 50% for keyword matching.

CONCLUSIONS:

This project “ ESSAY CHECKER “ is suggested by my internship mentor, from IEM-LAB. For this project I used python and Django. I also used internet to understand the task better.

THANK YOU.
